

Eventverse - Event and Festival Announcement System

Author: Rajkumar Kirar

Registration No.: 26BCE11128

Course: Python Essential

Academic Year: 2026-27

About the Project

Eventverse is a menu-driven Python application that announces upcoming events and festival celebrations. It keeps all important details in one place: event name and category, date and timing, venue, organizer name and contact, and participant details.

Features

- Add new events and festivals
- View all upcoming events (sorted by date)
- Search events by name, city, venue, category or date

- Register participants for an event
- View the participant list of an event
- Update event details (name, date, time, venue, organizer contact)
- Cancel / delete an event
- Data is saved permanently in a `events.json` file

Requirements

- Python 3.10 or above
- No external libraries needed (uses only `json` and `datetime` from the standard library)

How to Run

1. Download or copy `main.py` into a folder.
2. Open a terminal / command prompt in that folder.
3. Run:

```
python main.py
```

(On some systems use `python3 main.py`.)

Menu Options

Option	Action
1	Add new event
2	View all upcoming events
3	Search events
4	Register participant
5	View participants of an event
6	Update event
7	Cancel / delete event
8	Exit

Data Stored for Each Event

Field	Description
event_id	Unique ID given automatically
title	Name of the event / festival
category	Festival, Cultural, Sports, Technical, etc.

Field	Description
description	Short description
date	Event date (YYYY-MM-DD)
time	Start and end timing
venue, city	Where the event is held
organizer_name, organizer_contact	Organizer details
participants	List of registered participants (name, contact)

Sample Output

```
[101] Diwali Night (Festival)
  Description : Cultural evening
  Date       : 2026-11-08
  Time       : 6 PM - 10 PM
  Venue      : Community Hall, Bhopal
  Organizer  : Anita Sharma
  Contact    : 98000001
  Participants: 1
```

Project Files

```
Eventverse/  
|-- main.py      # Main program  
|-- events.json  # Created automatically  
when the first event is added  
|-- README.md    # Project documentation
```

Future Improvements

- GUI (Tkinter) or web version (Flask / Django)
- Database support (SQLite / MySQL)
- User login for organizers and participants
- Email / SMS reminders

Conclusion

Eventverse shows how core Python concepts such as functions, lists, dictionaries, loops, conditions and file handling can be used to build a practical event announcement system.
